Theory and equipment of ships (Teoriya i ustroystvo sudov) Moscow, Izd-vo "Transport",
65. 0371 p. illus., biblio. Errata slip inserted. 8,000 copies printed.

TOPIC TAGS: shipbuilding engineering, marine engineering, ship component, ship
navigation, marine engine, hydrodynamics /

PURPOSE AND COVERAGE: This book studies the problems of the theory of ships (statics
and dynamics) and gives a basic survey of ship engines, construction and the stabi-
lity of a ship's hull, structures and systems. This manual is recommended for stu-
dents in ship navigation departments of the higher engineering marine schools and al-
so can be used by students in other departments of the same schools. This book would
be useful for students and engineers in the Navy.

TITLE: A buffer device. Class 65, No. 180970

SOURCE: Izobreteniya, promyshlennyye obraztsy, tovarnyye znaki, no. 8, 1966, 136

TOPIC TAGS: ship component, shock absorber

ABSTRACT: This Author Certificate presents a buffer which prevents damage to ships being docked. The device includes power hydraulic cylinders and rotating self-adjusting carriages with recoil rollers (see Fig. 1). The design increases the operational reliability of the device. The rods of the power hydraulic cylinders are connected with slide-blocks. The ends of the connecting rods are mounted on these slide-blocks so that they can move. The other ends of the connecting rods are flexibly fastened to a rotating beam. This beam is hinged on one side to the rotating self-adjusting carriage, and on the other side it is hinged to a double arm rotating lever. This double arm lever is connected with a shock absorbing torsion bar unit by a hinge-arm drawbar.

TITLE: Liquid-phase hydrogenation of 1-heptene on ruthenium-palladium catalysts of various compositions

SOURCE: AN KazSSR. Institut khimicheskikh nauk. Trudy, v. 14, 1966. Katalizatory, zhidkofaznoy gidrogenizatsii (Catalysts of liquid-phase hydrogenation), 222-225

TOPIC TAGS: hydrogenation, heptene, ruthenium, palladium

ABSTRACT: 1-Heptene was hydrogenated in 96% ethanol at 20°C on Ru-Pd catalysts in which the Ru content was varied (19, 30, 44, 80 wt. % Ru). As the Ru content increased, the hydrogenation rate rose at first, reached a maximum at 70 wt. %, then decreased. The reaction was studied most thoroughly on catalyst with 30% Ru at 10, 20, 30, 40 and 50°. The S-shaped kinetic curves obtained suggest that the hydrogenation is associated with isomerization involving the displacement of the double bond to the center of the molecule and cis-trans isomerization. Chromatographic analysis and IR spectra showed that this isomerization of 1-heptene is limited to the formation of cis- and trans-2-heptene (in 20.5 and 33.7% maximum yield respectively). Orig. art. has: 4 figures.

117 The removal of moisture of hydration from new formed compositions in portland cement by heating. K. B. Goryunov. *Doklady Akad. Nauk Ukrain. R.S.R.* 1955; No. 3, 274-6 (Russian summary). The removal of moisture starts in the range of 80-100° and continues up to 1000°. The change of moisture content at different temps. confirms the existing idea of the hydrolysis and hydration of the portland-cement compds. Investigations were carried out by thermal gravimetric analysis by using the Tsvetkov app. (C.A. 49, 12195c). The accepted method is more accurate than the curves obtained on the N. S. Kurnakov device.

Title : Interaction of lime with Portland cement hydration products and mineral wool fibers

Periodical : Zhur. prikl. khim. 28, 8, 817-821, 1955

Abstract : The effect of Portland cement hydration products on mineral wool (nine different chemical structures) was studied. Mineral wool fibers whose chemical composition corresponds to the crystallization fields C_5A_3 and CA of the ternary system $CaO-Al_2O_3-SiO_2$ could be used for the reinforcement of cement if their diameter exceeds 6 μ . Two tables, 4 photos, 5 references, all Russian (1951-1953).

GORYAYNOV, K. Ye

MIT

Dehydration by heating for the determination of new formations in hydrated minerals of portland cement. K. E. Goryaynov. *Doklady Akad. Nauk S.S.S.R.* 104, 482-3 (1955). The thermobalance method of Tsvetkov (C.A. 49, 12195a) is used for dehydration studies of the hydration products of synthetic $3\text{CaO} \cdot \text{SiO}_2$, $3\text{CaO} \cdot \text{Al}_2\text{O}_3$, $2\text{CaO} \cdot \text{SiO}_2$, $5\text{CaO} \cdot 3\text{Al}_2\text{O}_3$, $4\text{CaO} \cdot \text{Al}_2\text{O}_3 \cdot \text{Fe}_2\text{O}_3$, $2\text{CaO} \cdot \text{Fe}_2\text{O}_3$, $2\text{CaO} \cdot \text{Al}_2\text{O}_3 \cdot 7\text{H}_2\text{O}$, and $3\text{CaO} \cdot \text{Al}_2\text{O}_3 \cdot \text{CaSO}_4 \cdot 12\text{H}_2\text{O}$. Samples of 0.3-g. wt. were used in a torsion balance directly, indicating the wt. losses as functions of the temp. increase. The rate of heating was 2-3-3.3°/min. up to 1000°. The curves show characteristic arrest and break points which are discussed in their importance for the calcn. of the adsorbed and chemically bound amts. of H_2O of the hydrated products. The adsorbed H_2O is generally driven out in the interval of 100-160°; the bound H_2O is calcd. from the wt. losses at 1001° in wt. % of the hydrated original compds. The results are in good agreement with those previously detd. by Burt (*Dissertation*, D. I. Mendeleev. Moskov. Khim.-Tekhnol. Inst. 1945) for $3\text{CaO} \cdot \text{SiO}_2$, $3\text{CaO} \cdot \text{Al}_2\text{O}_3$, $2\text{CaO} \cdot \text{SiO}_2$, and $4\text{CaO} \cdot \text{Al}_2\text{O}_3 \cdot \text{Fe}_2\text{O}_3$, but they are decidedly lower than those given for $3\text{CaO} \cdot \text{SiO}_2$ and $2\text{CaO} \cdot \text{SiO}_2$ by Powers and Bawnyard (C.A. 40, 7551⁴) who detd. the evaporable H_2O in *vacuo* and the bound H_2O as the not-evapd. share. For this reason, the results of the latter authors must not be directly compared with those of the present investigation. W. Eitel

Title: Gas Concrete Based on Entrainment Ash of Leningrad Heat and Power
Stations

Original

Publication: Novaya tekhn. i peredov. opyt v str-ve, 1956, No 6, 11-14

Abstract: It was found that on the basis of entrainment-ash of Leningrad electric power stations it is possible to produce gas concrete with a volumetric weight of 820-950 kg/m³ and a compression strength of 80-100 kg/cm². Expenditure of Portland cement is of 160-230 kg/m³, that of aluminum powder 200-300 g/m³. There is described the technology of production of large gas concrete wall blocks, the manufacture of which is being set up at the Leningrad plant of Trust No 20.

TITLE: The Effect of Content of Cement Grout on the Time of
Casting of Stiff Concrete Mixes (Vliyanie soderzhaniya
tsementnogo testa na udoboukladyvayemost' zhestkikh
betonnykh smesey).

PERIODICAL: Beton i Zhelezobeton, 1958, Nr.12, pp.453-457 (USSR)

ABSTRACT: New directives for casting stiff concrete mixes are given
in Norm NII-200. The method described here was used in
works of N.V. Mikhaylov and P.A. Rebinder on sand concrete.
Whereas the old method was based on the time which was
required to consolidate the concrete mix till it reached
the calculated weight per unit of volume, the new method,
which aims at greater accuracy of timing of casting,
consolidates the concrete mix by vibration in conjunction
with loading. To measure this time special apparatus is
used (see Fig.1). It consists of a cube-shaped frame of
100 x 100 x 100 mm, and a lid. The form is filled with
a certain amount of concrete mix, and after thorough

Card 1/4

SOV/97-58-12-4/13

The Effect of Content of Cement Grout on the Time of Casting of Stiff Concrete Mixes.

consolidation the weight of the volume is ascertained. A load of 80 g/cm^2 is applied and then vibration of 2800 oscillations/minute at an amplitude of 0.35 mm. Tests carried out in accordance with NII-200 show that the time of casting stiff concrete mixes, even if the cement/water ratio is constant, varies considerably with varying content. The characteristics of such variation are shown in curves of Fig.2. Table 1 gives values of the time of casting of concrete mixes containing various quantities of cement grout of uniform initial cohesion (at a constant water/cement ratio of 0.35); and Table 2 gives similar values but with a constant quantity of cement grout and varying proportions of sand and aggregate. A formula is given to define the limit of compression strength for optimal mix used in the above tests. The authors of this article with I.I. Nyauronia, of the Institute of Building and Architecture of the Academy of Sciences, Litovskaya SSR (Institut stroitel'stva i arkhitektury AN Litovskoy SSR), found

Card 2/4

SOV/97-58-12-4/13

The Effect of Content of Cement Grout on the Time of Casting of Stiff Concrete Mixes.

that the coefficient α in this formula has varying minimal values (see Table 3). Fig.3 gives curves showing the effect of the relationship between coarse and fine aggregates on the time of casting stiff concrete mixes and the strength of the concrete. Table 4 gives the time of casting stiff concrete mixes prepared from concrete containing 275 kg cement/m³ and 110 l.water/m³. Fig.4 shows the relationship between the strength of fine aggregate concrete and cement consumption (according to Prof. A.V. Mikhaylov). Tests showed that it is advantageous to use stiff concrete mixes with relatively small content of cement grout, but it is then necessary to use new vibrators for consolidation. These new vibrators have high amplitudes which allow better consolidation. Such a vibrator was designed by L.P. Petrun'kin and S.N. Naumov. It was also found that one-sided vibration of test cubes, carried out by Candidate of Technical Sciences B.D. Trinker, is less effective than vibration on both sides. Table 5 shows the effect of vibration

Card 3/4

SOV/97-58-12-4/13

The Effect of Content of Cement Grout on the Time of Casting of Stiff Concrete Mixes.

under loading on the consolidation time of stiff concrete mixes. Fig.5 gives comparative values of consolidation tests on stiff concrete mixes consolidated with vibrator, and mixes consolidated with vibrator in conjunction with loading of 80 g/cm^2 . Table 6 shows the effect of vibration under loading on the duration of consolidation of stiff concrete mixes. On the basis of these investigations the "Barrikada" factory and VNIISTROMMASH (authors K.E. Goryaynov, I.I. Mamontov, B.D. Trinker and I.I. Dolitskiy), in accordance with NII-200, designed and constructed a machine suitable for casting and consolidating stiff concrete mixes. When various items, as for example slabs PKZhN, are produced this machine consists of two mobile gantries; to the first dozing installation is attached, and to the second a strong vibrating press, with vibrator of 3000 and 6000 oscillations per minute with amplitudes of 1 and 0.3 mm. There are 5 figures and 6 tables.

AUTHOR: Goryaynov, K. E.

TITLE: Production of heat-insulating plastics based on slag or glass wool

PERIODICAL: Plasticheskiye massy, no. 1, 1963, 39-43

TEXT: Some requirements as to production for methods reinforced plastics based on slag or glass wool are pointed out. Phenol alcohol and urea phenol resins, or polyvinyl acetate emulsion, are used as binders in the USSR. The use of epoxy resins, which may be expected to give technically more stable reinforced plastics, has not yet been introduced. The necessity for a uniform distribution of the plastic over the fiber, the effect of type and quantity of the used polymer on the strength of the reinforced plastic, and the thermomechanical test of the polymers to find the maximum permissible heating are mentioned. It is required that the heat carrier (air) be introduced in the drying zone of the conveyer at a higher temperature (about 250°C) than in the zone of polycondensation. Automatic control of temperature, moisture, and gas volume is required

Card 1/2

Production of heat-insulating ...

S/191/63/000/001/010/017
B101/B186

during the drying process. In quality control, the tensile strength and the elasticity should be tested besides the volume weight. Some data are quoted from the author's papers: a film of 0.37μ thickness is formed on the fiber of slag wool with $900 \text{ m}^2/\text{g}$ specific surface and with 4% content of binder; with 10% binder content, the film is $0.9-1 \mu$ thick. The strength does not always increase with increasing content of binder. The tensile strength was $0.07-0.14 \text{ kg/cm}^2$ with a consumption of 120 kg of phenol alcohol resin per 1 ton of slag wool, volume weight of the finished product $70-110 \text{ kg/m}^3$. For plastics reinforced by slag wool, volume weight $120-150 \text{ kg/m}^3$, the tensile strength was tested under a load of 0.5 kg/cm^2 . Only 24% of the specimens based on phenol alcohol resin had perpendicular to the layer a tensile strength equal to or greater than 0.0015 kg/cm^2 , whereas all plastics based on chlorinated vinyl chloride satisfied this test. A volume weight of $12-30 \text{ kg/m}^3$ is reached by the new method of producing glass wool, blowing the melt with gas of 1150°C out of 5000-6000 openings, 1-2 mm in diameter, from bowl rotating at 3000 rpm. There is a volume weight having the lowest heat conductivity for any given temperature. The volume weight should be $20-40 \text{ kg/m}^3$ at 25°C , and about 180 kg/m^3 at 350°C .

 arc welding, chamotte brick arc welding

ABSTRACT: /The feasibility of joining certain refractories, ceramics,
 pyrocerams, and other mineral materials by arc welding¹⁵ has been in-
 vestigated. It was found that under certain conditions sound, homo-
 geneous, dense, and chemically stable welds can be obtained. Welding
 was done with an indirect arc, with hollow or solid graphite electrodes.
 Filler material was fed either in the form of a powder through hollow
 electrodes or in the form of rods. Welds between unpreheated chamotte
 bricks without any filler had a shear strength of 20—37 kg/cm². Pre-
 heating bricks up to 800C raised the strength to 57 kg/cm², and the

Card 1/2

TITLE:

The Mechanism by Which a Liquid Is Dispersed in a Plate Extractor and Ways of Improving the Dispersion (Mekhanizm dispergirovaniya zhidkostey v tarel'chatom ekstraktore i sposob.yego intensifikatsii)

PERIODICAL: Atomnaya energiya, 1959, Vol 7, Nr 2, pp 159 - 160 (USSR)

ABSTRACT:

The difference between the normal and the better modified version of the extractor consists in the fact that in the modified extractor an air inlet pipe is installed beneath the inlet for the light phase. This opening of the pipe is in the center of the column and is directed upwards. There are no overflow pipes in the extractor. The whole stream has to pass thru the openings in the plate. A stable operation of the column is ensured when the airflow moves at 0.03 m/s over the whole cross section of the column. When the airconsumption increases, bubbles form between the liquid drops and these bubbles reduce the contact surface. The new column with the air agitation system incorporated, was tested with the following systems: water -

Card 1/2

The Mechanism by Which a Liquid Is Dispersed in a Plate Extractor and Ways of Improving the Dispersion SOV/89-7-2-9/24

nitric acid - uranyl nitrate - tributyl phosphate in petroleum. The separation properties are approximately threetimes higher than those of a normal column. The total liquid load can be $\sqrt{30 \text{ m}^3/\text{m}^2}$ in case of an optimum air agitation. The dependency of the extraction capacity upon the intensity of the air agitation was determined by experiment. The result is shown in a diagram. The extraction loss caused by the air stream is negligibly small. There are 2 figures.
